EXCELLENCE IN STRUCTURAL ENGINEERING

Headquartered in Vancouver, B.C., with satellite offices in Kelowna and Nanaimo, Kor Structural ("KOR") provides structural engineering, consultation, design, and inspection services throughout B.C. and across North America. We deliver efficient, creative, and buildable solutions for projects of all sizes and types, including residential, commercial, institutional, and light industrial. Our expertise spans all forms of construction, including concrete, structural steel, wood-frame, mass timber and masonry.

Founded over 25 years ago by three seasoned professional engineers, KOR has grown into a team of 40+ professionals dedicated to client service, quality, and innovative building solutions. While operating as a unified, distributed team, we maintain a strong local presence. Our Okanagan office includes three Partners, while a fourth Partner oversees Vancouver Island projects from Nanaimo, along with a senior partner-led team dedicated to U.S. projects.

At KOR, we believe every development begins with a strong foundation. We bring first-class structural engineering expertise, cutting-edge technological innovation, and an unwavering commitment to your design team.

EXPERIENCE

KOR's portfolio includes diverse building types such as residential, mixed-use, commercial, office, industrial, institutional, public venues, and renovations. We collaborate closely with clients and industry professionals to integrate architectural needs into structural solutions. Committed to customer service excellence, we deliver high-quality projects that meet timelines and realize client visions. Over 25 years, KOR has designed 250+ high-rise towers across Western Canada and the Western U.S., including 24 in California, 3 in Seattle, 3 in Toronto, and 28 in Alberta.

We also have a dedicated team specializing in wood frame and mass timber and have designed over 200 projects of this type.

SERVICES

Structured Engineering is a purposeful marriage of creative design with efficient solutions, rigorous discipline and applied engineering principles and Building Codes. Structured Engineering means structured systems. At KOR, integrated engineering, drafting, and construction teams embrace agile workflow processes. Our efficient design solutions are creative, compliant, and economical.

KOR is constantly striving to improve efficiency and add value to clients. Our aim is to do great work and be easy to work with. Our core competencies include:

- Structural engineering for a wide range of building materials, including reinforced concrete, structural steel, wood-frame and heavy timber construction, tilt-up construction, and masonry.
 - Design of high-rise reinforced concrete structures.
 - Performance-based structural analysis and design.
 - Mass timber design with a dedicated wood-frame department.
 - Structural plan check and peer reviews.
 - Expert opinions and structural assessments.
-

SYSTEMS AND ORGANIZATIONAL QUALITY MANAGEMENT

As part of our commitment to delivering excellent service to our clients we have developed and follow gold standard operating systems with clear policies and procedures that drive efficiency for all our projects.

Our rigorous quality control practice follows the requirements for professional practice quality management set out in the EGBC Quality Management Guidelines and includes an Independent Engineering Check of all our designs by a professional engineer who was not involved in any aspects of the original design. At KOR, we adopt:

- An Organization Quality Management Policy structured from the EGBC Quality Management and Professional Practice Guidelines.
- Standardized policies and procedures, and well defined and regularly monitored project workflow with rigorous quality control at all stages of Design Development and Construction Review.

TECHNOLOGY

We look ahead to ensure that we are prepared to meet tomorrow's challenges. Technology is a critical enabler, and we employ both legacy and leading-edge industry software and technology to meet your needs. We use both AutoCAD and Revit/BIM, among others, to develop our construction documents and coordinate with design teams. To our clients, that means faster drawing development, improved accuracy, and real-time communication and collaboration.

We utilize state-of-the-art engineering design and drafting tools to develop and document our structural designs, including:

- 3D Seismic Analysis tools (e.g., ETABS and PERFORM3D Non-Linear Time History).
- Finite Element Slab Design tools (e.g., RAM Concept and SAFE).
- Space Frame structural analysis tools (e.g., STAAD Pro, RAM Steel, and SAP).
- Structure Point Package (e.g., spCol, etc.).
- 3D & 2D Drafting and Building information Modelling tools (e.g., REVIT, DYNAMO, BIM 360, and AutoCAD).
- Various in-house, custom-developed programs.
- An internal Communication and Collaboration computer dashboard know as 'KOR Hub,' which provides all staff with the tools they need to execute their work.

Further, we have a Dedicated IT Department with Internal Systems Manager focused on consistency, efficiency, and continual improvement of our systems and methods.

John Markulin

P.Eng., Struct.Eng., PE, SE

As Senior Structural Engineer and Managing Principal at KOR, John is responsible for delivering innovative structural engineering solutions for some of the firm's most notable projects. John is an accomplished engineer with significant project experience in the design of reinforced concrete, pre-cast concrete, cast-in-place concrete, post-tensioned concrete, tilt-up concrete, structural steel, load-bearing steel stud, wood-frame, and masonry, as well as floor systems, vertical load systems and seismic and lateral systems. From San Diego to Arizona to Whistler, his emphasis on producing project-specific and cost-effective designs that meet stringent architectural and economic constraints has helped KOR make numerous projects successful, including tall towers, mixed-use commercial and residential, light industrial warehouses, and institutional/public facilities such as ice rinks, sports facilities, and extended health care facilities, hotels, office buildings, and LEED Certified projects.

Jim DesRoches

P.Eng., PE

As a Senior Structural Engineer, and a Principal at KOR, Jim Manages our US projects. Jim has designed multiple developments across a variety of building types in Canada and the United States since 1988, including more than 50 high-rise projects throughout British Columbia, Alberta, Ontario, Washington, Oregon, Nevada, and California. Known for his creative structural solutions and emphasis on Customer Service. Jim uses his collaborative approach to every problem with an emphasis on client service. With over three decades of experience in Quality Control Management, Jim leads the development of Operational Quality Management Policy at KOR and is the Head of the Systems Department.

FEATURED LARGE MIXED-USE COMMERCIAL & RESIDENTIAL PROJECTS - CANADA

We have extensive experience with large residential and mixed-use buildings and have completed 2,000+ projects of all types from concrete high-rise (over 65 stories), concrete mid and low-rise, structural steel, and wood frame projects. The following illustrates some examples of large mixed-use projects we have designed.

PARADOX HOTEL VANCOUVER, 1161 WEST GEORGIA STREET, VANCOUVER, B.C.

FEATURED LARGE MIXED-USE COMMERCIAL & RESIDENTIAL PROJECTS - CANADA

Located in the financial district of downtown Vancouver, the 63-story tower is the second-tallest building in the city and one of the most iconic. The twisted hyperbolic paraboloid, design by architect Arthur Erickson and built by developer Holborn Group and TA Global, presented unique structural engineering challenges. Extensive and iterative planning and design was required to successfully achieve the various aspects of this distinctive tower.

The overall project includes market residential units from levels 26 to 63 and consists of three different floor configurations and a nine-level underground parking structure.

The Paradox Hotel Vancouver tower is tied with Altus (another KOR project) for the second tallest building in

British Columbia.

Client

Holborn Group and TA Global

Architect

Arthur Erickson

STATION SQUARE, 6000 MCKAY AVENUE, BURNABY, B.C.

FEATURED LARGE MIXED-USE COMMERCIAL & RESIDENTIAL PROJECTS - CANADA

Station Square is a large mixed-use development with multiple phases. Sites 2 and 3 feature 38- and 49-story residential towers integrated into a podium with retail and office space, atop four levels of underground parking. Site 4, located near the Metrotown SkyTrain and Metropolis at Metrotown, consists of a 35-story residential tower with retail and office space above four levels of underground parking. Site 5 includes a 41-story residential tower with 334 units, a three-level podium containing 40,000 sq. ft. of office space and 37,000 sq. ft. of commercial space, and a total buildable area of 308,762 sq. ft., supported by five levels of below-grade parking. Site 6 comprises a 52-story residential tower with 421 units and a three-level, 102,000 sq. ft. mixed-use podium, with a total buildable area of 408,898 sq. ft. and four levels of below-grade parking.
