Revit Team Meeting — Synopsis & Action Points

Meeting: “Revit team meeting before MLI departs” · 13 July 2026, ~8:31 PM · 50 min · Teams + Boardroom Prepared: by Ian Lalonde (Ops/IT) · For: drafting team follow-up Recording + transcript: Desktop\Revit - Michael\

Attendees (best identification): Ian Lalonde (remote), Jim & John “JM” (principals), Lindsay, Rory Beirne, Simon Szarkiewicz (remote), Nelson Yu, Michael Mousa; others in the room (Chris, Kevin referenced). Michael Li did not attend.

1. Synopsis — what was discussed

Context. Michael Li is exiting early (personal/stress). He is effectively not working, and — critically — **he took the source code for all his custom Revit plugins** (copied to a thumb drive Tuesday night). He was secretive, held his work close, and had repeatedly removed IT/remote-access tools from his machine over the years.

Project handoff. Michael Li had almost no active workload. The one live item (a tilt-up with panel shop drawings) is largely done and already picked up. Nothing critical is mid-stream. → Pull his project list from Deltek to confirm nothing slips.

Department management going forward. Michael Li reluctantly “project-managed” but communicated poorly, leaving the team blind to each other’s workload. **Decision: all drafters join the existing bi-weekly Monday workload / PM meeting** (Teams, always-on) so everyone sees who’s working on what, who needs help, and how new jobs get distributed. Drafters may optionally run their own drafting-specific check-in on alternate weeks. Ian will **demo the workload/PM tool** so drafters can track their own projects (filter by their name).

The plugins problem (the core issue). The custom tools are compiled DLLs on every machine, but **the source is gone**. When a new Revit version lands (2027), the tools break — the drafters believe it’s mainly the **shortcuts/customizations** (families upgrade fine). Ian’s plan: **reverse-engineer from a drafter’s compiled tools, then rebuild the toolset clean, centralized, and version-“agnostic”** so future Revit releases don’t break it. The team confirmed a key point — **they only use ~10% of the huge library**; most isn’t needed. No panic on timing: **Revit 2027 won’t hit production for ~6 months** (architects are delaying; some staying on 25/26).

The opportunity. Strong appetite to rebuild the tools better and add new ones drafters ask for — in plain language. Explicit goal: break the silos and rebuild both the tools *and* how the team communicates.

2. Decisions made

- All drafters **join the bi-weekly Monday workload meeting** (Teams).
 - **Rebuild the toolset properly** — clean, centralized, version-agnostic — not patch-and-duct-tape per Revit release.
 - **Follow-up demo meeting (Wednesday, ~2–3 PM, Teams):** drafters screen-share their Revit workflow (recorded) so Ian can see exactly what the tools do.
 - **Install Revit 2027 on a test machine** for upgrade testing — not on a production machine.
 - **Do not engage Solid CAD** (the wood-frame group) — too costly for the value; hire a specialist only for a specific problem if one arises.
 - **Reach out to Michael Li** to ask for the source and a smooth transition (John/JM to try).
-

3. Action points

#	ACTION	OWNER	WHEN
1	Install Revit 2027 on a test machine for upgrade testing	Ian	Right after the meeting
2	Test 2027 on a duplicated (test) project , document upgrade issues, send Ian the list	Michael Mousa	This week
3	Send Ian point-form: what each Revit tool does for you (layman's terms; email/Teams)	Each drafter (whoever knows best)	Before Wed
4	Schedule + run the Wednesday demo (~2–3 PM, Teams): each drafter screen-shares their workflow, recorded	Ian (invite) / drafters (demo)	Wed
5	Demo the workload/PM tool to drafters + provide a drafting-focused capacity view	Ian	Wed / ongoing
6	Demo the new KOR.RevitTools foundation (once tested/finished)	Ian	Wed / follow-up
7	All drafters join the bi-weekly Monday workload meeting	Ian (add them) / drafters	Next cycle
8	(Optional) drafters run their own drafting check-in on alternate weeks	Drafters	Ongoing
9	Contact Michael Li — request source on the thumb drive + smooth transition	John/JM (+ Jim)	ASAP
10	Pull Michael Li's active project list from Deltek to confirm nothing dropped	Ian / PMs	This week

4. Where it actually stands now (update since the meeting)

In the meeting Ian said he was “going off nothing.” That’s no longer true — significant progress has been made, which reframes Wednesday from “help me understand this” to “here’s what we’ve already recovered and built.”

- **Source partially recovered.** A portion of Michael Li’s **real, un-obfuscated source** was recovered from shadow copies, and **every deployed tool (DLL) is preserved** and organized — see P:\Recovery (source, DLLs, decompiled core, families, templates, standards).
- **Full accounting done.** The 195 tool files collapse to **78 distinct tools, of which only ~22 are actually loaded** — confirming the drafters’ “we only need ~10%.” Cut list + rebuild SOW are written (docs\KOR-Revit-Toolset-Accounting-and-Rebuild-SOW). A **one-page drafter worksheet** is ready to hand out Wednesday.
- **The rebuild has a working foundation — KOR.RevitTools.** A clean, modern codebase that **already builds for Revit 2024 / 2025 / 2026 from one project** (version-agnostic, using the Revit API NuGet — no per-machine paths), with first-pass tools across the main areas (Rebar, Visibility, Text, Views, QuickInsert, Dimensions, Units, Structural, Elements). **It needs testing + finishing**, but it’s a real, demonstrable proof of the exact “make it agnostic and clean” vision described in the meeting — ideal to show Wednesday.
- **Why the source is gone, confirmed.** Michael Li **deliberately obfuscated** his DLLs (with a tool called Obfuscator) — that’s why they can’t simply be read back, and why the physical thumb drive is the only route to the remaining source.

Net: the toolset is inventoried, partially recovered, and a version-agnostic replacement foundation exists and builds. Wednesday is about (a) capturing exactly what drafters use, (b) capturing what they *wish* they had, and (c) showing them the workload tool and the new foundation.

5. Wednesday follow-up meeting — proposed shape (~45 min, Teams, recorded)

1. **Each drafter:** ~5-min **screen-share** of their real workflow with the current plugins (what they click, what it does). Recorded.
 2. **Gaps round:** what do you do by hand, repeatedly, that a tool should do? (Use the one-page worksheet.)
 3. **Ian demos:** the **workload/PM tool** (so drafters can track their own jobs) + the **new KOR.RevitTools foundation** (the agnostic rebuild, already building for 24/25/26).
 4. Confirm the bi-weekly workload meeting cadence.
