KOR STRUCTURAL · DRAFTING STANDARDS

What you told me — please correct anything I got wrong

For Nelson Yu · from Ian Lalonde · after our call on 21 October

Thanks for walking me through it. Here's how I understood it. Nothing gets built or changed until you've told me this is right — mark it up, or just reply with what's off.

WHO DOES WHAT TODAY

STEP	WHO	HOW
Asks for a change	Engineers	A markup in `Cover Sheet Markups` — or sometimes a note on a job saying "update this in the master".
Says yes or no	Jim	Changes to the cover sheets go through him.
Draws it	You	Changes to the masters come to you, and you make them in CAD and in Revit. Lindsay works with you — you did the wood frame conversion together.
Checks it	An engineer	Completed Ready for Backcheck → Backchecked.
Publishes it	You, I think	A new dated PDF in `P:\Projects\00 Templates\000 Kor Master PDF Files`, old one to OLD.

A change applies to **new jobs only**. Jobs already underway keep the standards they started with — unless an engineer decides a particular job needs the fix.

WHERE IT LIVES — I: is the Drafting drive

WHAT	WHERE	NOTES
Revit templates	`I:\009_REVIT CUSTOMED\000_Project_Templates`	Concrete Tower R24 (has the wood frame in it too), Steel R24, and the Typical Details Container R23 — which not everyone knows is there.
CAD job template	`I:\Kor Structural\013 Project Templates\AutoCAD`	The cover sheet drawings and sheet sets a new CAD job starts from. No towers in CAD any more.
CAD typical details	`I:\Kor Structural\002 Typical Details`	KOR TYPICAL DETAILS.dwg, laid out the same as the PDF, plus the details blocks.
Wood frame details	`I:\Kor Structural\004 Wood Framing`	KOR TYPICAL WOOD FRAMING DETAILS.dwg.
Schedules	`I:\Kor Structural\007 Plan Schedules\Concrete`	Plan Schedules.dwg — every schedule on one big sheet, so you find things by looking, not by name.

WHY THERE'S A CAD SET AND A REVIT SET

Converting doesn't work in either direction. CAD brought into Revit keeps colours meant for a black screen — yellow text on white — and its line weights don't carry over. Revit turned into CAD — export, linking it in, or a PDF — gets the line weights and colours wrong again. And engineers change cover sheet notes on most jobs anyway. With both masters, a change is made **twice and that's the end of it**. Making one from the other would mean doing it again on every job. **I'll build around the two sets, not against them** — the thing worth fixing is never knowing which one is right, not having two.

STILL NEED FROM YOU

1. **Which Revit version do new jobs start in now?** The templates are R23 and R24.
2. **Low-rise concrete in CAD** — which file is the current cover sheet?
3. **The Steel R24 template** — who looks after it?

WHAT I'LL DO NEXT

1. Check what I built against your templates and drawings — including which of my Revit details are really CAD brought in — and show you the differences before anyone uses it.
2. Try the Revit-to-CAD export once, properly, so the question is settled either way.
